

### Rubber Expansion Joint for Abrasive Media

Rubber expansion joints are components for pumping and piping systems, suitable to compensate movements, noise and vibration.

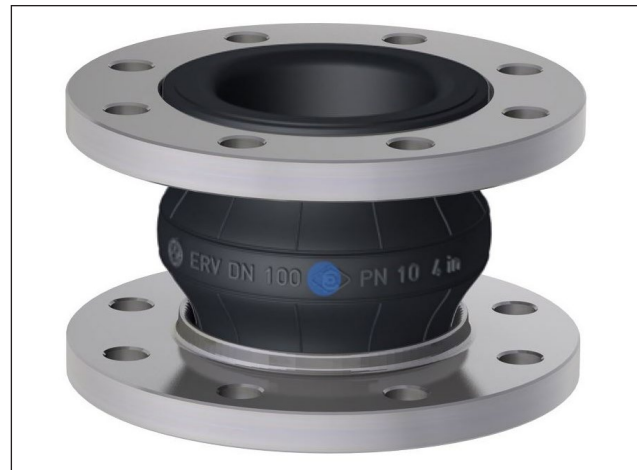

For media containing abrasive components, Elaflex now offers the new type ERV-BR made of a highly abrasion resistant special rubber compound. Except for extreme strain (e.g. sharp and rough-edged matter) it is now no longer necessary to use an additional inner protection sleeve.

ERV-BR is suitable for sludges, slurries, solid/liquid mixtures or emulsions, and dustlike or powdery products. Available sizes DN 25-300, larger dimensions on request.
