

Extended Online Nozzle Configurator from Elaflex

Whenever many options are available, the use of online product configurators become increasingly popular to select suitable products.

Since 2012, German refuelling specialist Elaflex has adopted this principle for its main product ranges and created configurators for ERV rubber expansion joints, hose assemblies and nozzles.

These interactive tools are intended to save buyers, consulting engineers and installers time. Users can virtually select and 'build' their required product without having to compare various data sheets.

Recently a major update of Elaflex' nozzle configurator took place, incorporating new product information, increased speed and a greatly improved usability.

At the beginning of the configuration, it is now possible to find the suitable type via the new "Selection Guide" by choosing basic properties such as application, media or required flow rate.

At the end of the configuration, the correct nozzle part number is displayed. Before the user sends a request for quotation, additional items now can be added.
